Re: Site Assessment Report
Former Waccamaw Transport, Inc.
1106 South 2nd Street
Wilmington New Hanover County, NC
Incident No. Pending

Dear Ms. Henderson:

Please find enclosed the referenced report for the above mentioned site. If you have any questions, please do not hesitate to contact Anthony Scarbraugh at (252) 217-5820.

We appreciate the opportunity to provide these services to you.

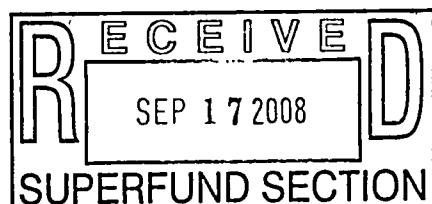

Sincerely,
Geological Resources, Inc.

A handwritten signature in black ink that appears to read "Christina Terry".

Certification

I, John M. Brown, a Licensed Geologist for Geological Resources, Inc., do certify that the information contained in this report is correct and accurate to the best of my knowledge.

Geological Resources, Inc. is licensed to practice geology and engineering in North Carolina. The certification numbers of the company are C-127 and C-2727, respectively.

2.0 Site Assessment History and Source Characterization

A Phase II Environmental Site Assessment (ESA) was conducted at the site in November 2007 by Henry Nemargut Engineering Services. According to data contained in the Phase II ESA report, recognized environmental concerns (RECs) were identified during the Phase II assessment activities. Specifically, the

RECs identified were a former diesel UST basin, a heating oil UST basin, an exterior concrete pad containing waste oil storage drums and an exterior concrete pad formerly used for vehicle engine repair. A total of 5 soil borings (B-1 through B-5) and one temporary monitoring well (TW-1) were completed at the site in November 2007. Based on field screening with a PID, a total of 4 soil samples were submitted for laboratory analyses.

Soil boring B-1 was located in the driveway on the 1109 South Front Street property. Soil sample screening results were below the PID detection level; therefore no sample was submitted for laboratory analyses. Soil borings B-2 and B-5 were located adjacent to the existing and within the former UST basins, respectively. The soil samples from each boring with the highest PID readings (B-2-7' and B-5-10') were submitted for laboratory analyses for diesel- and gasoline-range total petroleum hydrocarbons (TPH) by EPA Methods 3550/5030/8015. Based upon the laboratory analytical report, no detectable concentrations of TPH were reported in the samples collected from B-2 and B-5.

Soil borings B-3 and B-4 were located adjacent to the engine repair and drum storage pads, respectively. Soil samples were collected in the native soils and submitted for laboratory analyses by EPA Method 8260. Detectable concentrations of tetrachloroethene (PCE) were reported in soil samples B-3-5' (0.0076 mg/kg) and B-4-5' (0.26 mg/kg). Both detectable concentrations exceeded the NCDENR soil-to-ground water maximum soil contaminant concentration (MSCC) for PCE (0.0074 mg/kg).

Soil boring B-2 was completed as a temporary monitoring well (TW-1). A ground water quality sample (TW-1A) was collected and submitted for laboratory analyses by EPA Method 6210D. Detectable concentrations of PCE and chloromethane which did not exceed the North Carolina drinking water standard established in T15A NCAC .0202L were reported in the ground water sample.

Based upon the results of the Phase II ESA, GRI was retained to assess the extent of PCE in the soil. Six soil borings (SB-1 through SB-6) were advanced, each to a depth of six feet, and soil samples were collected from each at a depth of 5-6 feet. The collected soil samples were analyzed by EPA Method 8260. Detectable concentrations of ethylbenzene, xylenes, naphthalene, 1,3,5-trimethylbenzene and/or 1,2,4-trimethylbenzene which did not exceed the MSCCs were reported in soil samples SB-2(5-6) and SB-3(5-6). Detectable concentrations of PCE which exceeded the soil-to-groundwater MSCC were reported in soil samples SB-2(5-6) through SB-5(5-6). None of the reported concentrations exceeded the Residential MSCC. Based on this data, a proposed excavation area was determined.

On February 18 and 19, 2008, GRI staff supervised the excavation of approximately 346.20 tons of soil from the identified areas of soil contamination. The excavation was limited within two feet of the on-site structure due to concerns of compromising the structural integrity of the building. At the conclusion of over-excavation activities, confirmation soil samples CS-1(7-8), CS-2(7-8), CS-3(7-8), CS-4(7-8) and CS-5(8.5-9.0) were collected along the sidewalls and the bottom of the excavation. Soil samples were submitted for laboratory analyses using EPA Method 8260. A detectable concentration of PCE reported in CS-4(7-8) exceeded the soil-to-ground water MSCC; the concentration did not exceed the Residential MSCC.

On April 8, 2008, GRI staff supervised the excavation of approximately 31.62 tons of additional soil from the vicinity of CS-4 (7-8). Subsequent to over-excavation activities confirmation soil samples CS-6(6-7) and CS-7(9) were collected along the northern sidewall and the bottom of the excavation basin, respectively. Soil samples were submitted for laboratory analyses using EPA Method 8260. Detectable concentrations of PCE reported in CS-6(6-7) and CS-7(9) exceeded the soil-to-ground water MSCC; the concentrations did not exceed the Residential MSCC. No further soil excavation could be conducted due to the potential for undermining the existing on-site structure.

GRI personnel contacted Ms. Ginny Henderson with the NCDENR-DWM on April 16, 2008 concerning assessment and remedial activities conducted at the site to date and limitations for future excavation. It was recommended that GRI collect TCLP samples in the approximate location of soil borings CS-6 and CS-7 to confirm removal of PCE contaminant concentrations in excess of the soil-to-ground water MSCC. Based on this recommendation, GRI personnel mobilized to the site on April 24, 2008. Two soil borings were advanced in the approximate locations of soil samples CS-6 and CS-7. Soil samples from CS-8 and CS-9 were collected from 7 and 9 feet, respectively. Soil samples were submitted for laboratory analyses using TCLP for volatile organic compounds. No detectable concentrations of PCE were reported in samples CS-8(7) and CS-9(9).

Sampson-Bladen Oil Company received a Notice of Regulatory Requirements (NORR) dated June 26, 2008 specifying additional assessment at the site. Please note that Waccamaw Transport, Inc. is the property owner of this site and should have received the NORR. Sampson-Bladen Oil Company has no connection with this property. An assessment workplan was submitted by GRI on July 16, 2008 and approved with modifications by the NCDENR Inactive Hazardous Sites Branch on July 17, 2008.

3.0 Receptor Information:

foot radius of the source area. No public water supply wells were identified within a 1,500 foot radius of the source area. However, a more detailed site reconnaissance will need to be performed during future scopes of work to determine the potential presence of private water supply wells.

B. Public Water Supplies:

Public water is provided to the site and surrounding properties by the Cape Fear Public Utility Authority.

C. Surface Water:

The Cape Fear River is located approximately 1,300 feet to the west of the site. No other surface water bodies were identified during preliminary receptor activities.

D. Wellhead Protection Areas:

According to the NCDENR (http://wse20.deh.ehn.state.nc.us/Swap_app/viewer.htm) there are no existing or proposed wellhead protection areas within 1,500 feet of the source area.

E. Deep Aquifers in the Coastal Plain Physiographic Region:

The surficial aquifer directly overlies the Castle Hayne confining unit and aquifer.

F. Subsurface Structures:

No structures with basements were observed in the vicinity of the source area and utilities in the area do not appear to intersect the seasonal high water table.

G. Historical and Present Land Use:

According to information provided by Mr. Rogers Clark, owner of Waccamaw Transport, the properties at 1106 S. Second Street and 1109 S. Front Street were purchased by Waccamaw Transport, Inc. in 1953. The property located at 1106 S. Second Street was vacant and the property located at 1109 S. Front Street was residential. The residential structure was moved in 1963. The property located at 1106 S. Second Street was developed in 1963. Waccamaw Transport, Inc. began operation in 1964 and continued until 1978. Mr. Clark stated that the facility was utilized as an operation dispatch office for commercial fuel trucks. Mr. Clark stated the facility was also utilized for parking vehicles and minor commercial truck repair. The property was vacant from 1978 until 1996. From 1996 until May of 1997 the facility was leased to K&R Hydraulics. K&R Hydraulics utilized the facility to overhaul and fabricate equipment hydraulic cylinders. From September 1997 to August 1999 the property was leased to Specialty Equipment Rentals. Specialty Equipment Rentals utilized the facility for equipment rental and sales. During October 1999 to December 1999 the facility was leased to C. Knight and Prosser as a hydraulic and machine shop. The property was vacant from December 1999 to June 2001. From June 2001 until June 2003 the facility was leased to Henry McCloud Mac's Auto Care as an automobile sales and repair facility. From June 2003 to the present the facility has been leased by Dale Lovitt's Auto Sales and utilized as an automobile detailing and servicing facility. The site currently operates as Lovitt's Auto Sales. Residential properties border the site to the north. The on-site structure located along the northeastern corner of

the site is utilized as a sales office and for automobile repair and servicing. A six-foot security fence is located along the eastern, southern and western perimeters of the site.

Industrial properties border the site to the west and south. South 2nd Street borders the site to the east. Residential properties are located across South 2nd Street to the southeast, east and northeast of the site. The site is zoned light industrial (IM). The surrounding properties are a mixture of residential (R-3) and light industrial (IM). Population density in the area is high. A Site Vicinity Map showing all properties within a 1,500-foot radius of the site is included as Figure 3

H. Property Owners and Occupants:

Adjacent property owner information has been summarized in Table 1.

4.0 Regional Geology and Hydrogeology

According to the 1985 Geologic Map of North Carolina, the site is located within the Coastal Plain Physiographic Province. The Coastal Plain is part of an extensive geologic province that roughly parallels the Atlantic Ocean and continues northward and southward through the neighboring states. The Coastal Plain consists of a sedimentary wedge overlying crystalline basement rock which ranges in thickness from 0 feet in the west along the fall line to over 10,000 feet to the east along the Atlantic coast. In North Carolina, the Coastal Plain is expressed in three regional belts: the Sand Hills, the Inner Coastal Plain and the Tidewater Region or Outer Coastal Plain. The surface deposits in the Coastal Plain are generally characterized by a recurrent sequence of clean fine to medium sand, muddy fine sand, and clean to muddy, medium to coarse sand or gravelly sand. These textures represent changes in depositional environments from beach to back-barrier to river, respectively.

The major aquifers in the area of the site in descending order are the surficial aquifer, Castle Hayne aquifer, PeeDee aquifer, Black Creek aquifer and Upper Cape Fear aquifer. Each aquifer system consists of a confining or semi-confining unit overlying more permeable units. Surficial soils consist of sand, clay and gravel deposited in various marine, fluvial, eolian and lacustrine environments.

According to the Hydrogeologic Framework of the North Carolina Coastal Plain, the Castle Hayne aquifer system, which consists of the Castle Hayne confining unit and aquifer, underlies the surficial aquifer in the area of the site. The Castle Hayne Formation is composed largely of fossiliferous limestone, with minor amounts of sand. The confining unit appears to be approximately 10 feet thick in the area of the site.

5.0 Site Geology and Hydrogeology

Based on observations made during installation of the Type II monitoring wells during assessment activities, surficial soils at the site consist primarily of tan to orange fine to medium sands to a depth of 18 feet, the terminal depth of the boring. Depths to groundwater in the Type II monitoring wells ranged from 13.08 to 13.90 feet below top of well casing on July 24, 2008. A summary of ground water elevation data obtained during assessment activities to date is presented in **Table 2**. A Ground Water Flow Map based on the July 24, 2008 data is included as **Figure 4**.

6.0 Soil Assessment

Based on the soil sampling activities outlined in the previously referenced Assessment Work Plan, GRI supervised the installation of three monitoring wells (MW-1 through MW-3) and three soil borings (SB-10 through SB-12) at the site on July 24, 2008. Soil samples were collected during the installation of MW-1 through MW-3 and designated as SB-7 through SB-9, respectively. Soil samples were collected from 0 – 0.5 feet, 0.5 to 1.0 feet, approximately 5.0 feet and 10 feet below ground surface (bgs). Soil samples from soil borings (SB-8 and SB-12) were collected at sampling depths of 10 feet only since the soil borings were located in the former excavation area. Laboratory analyses were performed on the soil samples for volatile organic compounds (VOCs) by EPA Method 8260, for semi-volatile petroleum hydrocarbons (SVOCs) by EPA Method 8270 + 10 TICs and for 14 hazardous substance list metals by EPA Method 6010B/3030C and 7471.

Detectable concentrations of toluene, xylenes, naphthalene, acetone, carbon disulfide, 2-butanone, chloroform, tetrachloroethene, 1,3,5-trimethylbenzene, 1,2,4-trimethylbenzene, di-n-butylphthalate, butylbenzylphthalate, bis(2-ethylhexyl)phthalate and/or benzo(g,h,i)perylene were detected in each of the collected soil samples. In addition, one or more of the target metals, with the exception of beryllium and thallium, were detected in each of the soil samples. However, none of the reported concentrations exceeded the Inactive Hazardous Sites Branch Health-Based Soil Remediation Goals (HBSRG). A summary of the analytical results of the soil samples collected at the site to date is presented in **Table 3**. Soil and purged water generated from the installation and sampling of the soil borings and monitoring wells were placed in 55-gallon drums and staged on-site. A material manifest will be forwarded to the NC DENR upon receipt. A Site Map depicting the soil boring locations has been included as **Figure 2**. A Soil Quality Map showing the locations of the soil borings as well as individual BTEX constituent, PCE, arsenic and mercury concentrations in the soil samples from the July 24, 2008 sampling event is included as **Figure 5**. A complete report of laboratory analyses of soil and ground water samples collected during the July 2008 sampling event has been included as **Appendix A**.

7.0 Ground Water Assessment

Three Type II monitoring wells (MW-1 through MW-3) were installed during assessment activities on July 24, 2008. Monitoring well MW-1 was installed in the inferred up-gradient direction from the source areas to a depth of 18 feet. Monitoring wells MW-2 and MW-3 were installed in the inferred down-gradient direction to depths of 18 feet. Each of the wells were completed with a 10-foot screened interval. The locations of the monitoring wells are shown on **Figure 2**. Well construction records for the monitoring wells installed during assessment field activities have been included as **Appendix B**.

On July 24, 2008, monitoring wells MW-1 through MW-3 were gauged, purged and sampled. Please note that all sampled monitoring wells were purged and sampled using a low flow pump. Laboratory analyses were performed on the ground water samples for volatile organic compounds (VOCs) by EPA Method 8260, for semi-volatile organic compounds (SVOCs) by the EPA Method 8270 + 10 TICs and for 14 hazardous substance list metals by EPA Method 6010B/3030C and 245.1.

Concentrations of PCE that exceeded the 2L Standard specified in T15A NCAC 2L.0202 were reported in the ground water samples collected from MW-1, MW-2 and MW-3. Concentrations of manganese that exceeded the 2L Standard were reported in ground water samples collected from MW-1 and MW-2. However, according to A Hydrogeochemical Atlas of North Carolina, historical ground water data for the Wilmington area indicates that manganese concentrations typically range from less than 25 ppb to more than 89 ppb, with values for the range of as much as 3,758 ppb. Therefore, reported manganese concentrations may be attributable to natural conditions. A Ground Water Quality Map has been included as **Figure 6**. An abridged summary of laboratory analyses from the sampling event conducted during assessment activities has been included as **Table 4**.

8.0 Hydrogeologic Investigation

The depths to ground water in the Type II monitoring wells on-site measured on July 24, 2008 ranged from 13.08 to 13.90 feet. Ground water elevations ranged from 86.44 to 86.92 feet relative to a temporary benchmark with an assumed datum of 100.00 feet. Ground water flow is generally in a south-southwest direction. The average horizontal hydraulic gradient at the site was 0.038 feet per foot. A Ground Water Flow Map based on the July 24, 2008 data is included as **Figure 4**. A summary of ground water elevation data obtained during assessment activities is presented in **Table 2**.

9.0 Discussion

- Historically, the facility has operated as various commercial and industrial enterprises, some of which have included vehicle repair facilities, from initial development in 1964 to the present. Surrounding properties are a mixture of residential and commercial use.
- No public water supply wells were located during a review of the NCDENR's wellhead protection area web-site. However a more detailed investigation should be conducted to determine the presence of private water supply wells. Public water is provided to the site or surrounding properties by Cape Fear Public Utility Authority.
- The Cape Fear River is located approximately 1,300 feet west of the site. No other surface water bodies were identified during assessment activities.
- The surficial aquifer and the Castle Hayne confining unit appear to be relatively thin in the area of the site. Therefore, there is the potential for contaminant migration to the underlying Castle Hayne aquifer.
- VOCs, SVOCs and/or metals were reported to be present in each of the soil samples analyzed. However, none of the concentrations exceeded the HBSRG. Based on the soil quality data obtained during the excavation and assessment activities conducted by GRI, it appears that no soil contamination exceeding the IHSB HBSRGs is present in the areas sampled.
- Three Type II monitoring wells were installed during assessment activities. The average depth to ground water in the Type II monitoring wells during the July 2008 gauging/sampling event was 13.50 feet. Ground water flow was generally toward the south-southwest.
- Concentrations of PCE that exceeded the 2L Standard were reported in ground water samples collected from each of the monitoring wells. Concentrations of manganese that exceeded the 2L Standard were reported in ground water samples collected from MW-1 and MW-2. However, the reported concentrations are well within the range of values typical for the Wilmington area, as reported in A Hydrogeochemical Atlas of North Carolina. Therefore, the reported concentrations of manganese are most likely naturally occurring.

10.0 Recommendations

- Since no contaminant concentrations are known to remain on site in excess of the IHSB HBSRGs, no additional soil assessment is recommended.
- The horizontal and vertical extent of PCE in the ground water should be assessed.
- A detailed receptor survey should be conducted in order to evaluate potential health risk exposure pathways.

11.0 Limitations

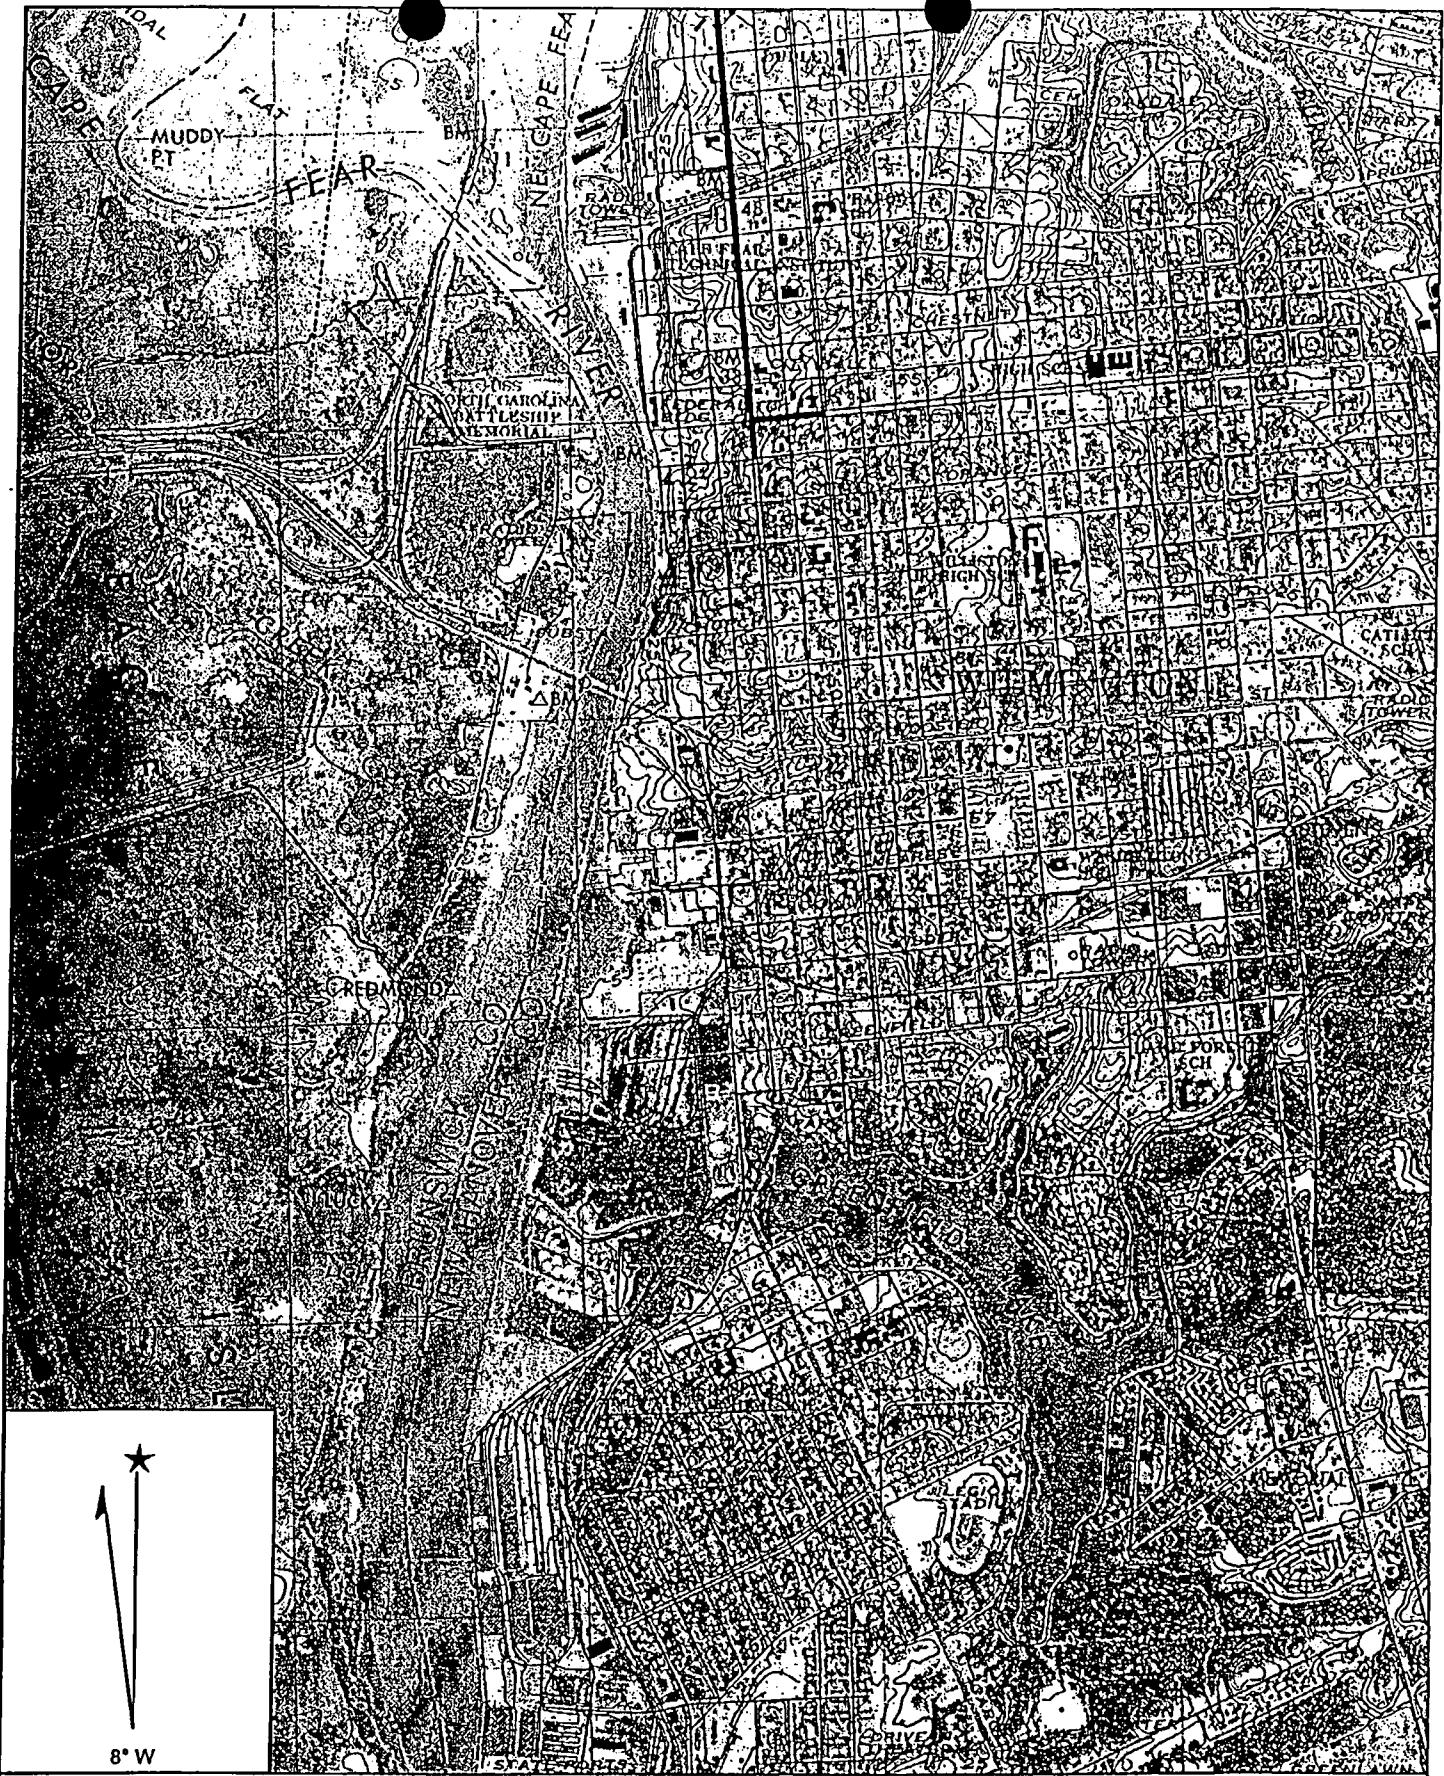

This report has been prepared for the exclusive use of Waccamaw Transport, Inc. for specific application to the referenced site in New Hanover County, North Carolina. The assessment was conducted based on the scope of work and level of effort specified by the NC DENR and with resources adequate only for that scope of work. Our findings have been developed in accordance with generally accepted standards of geology and hydrogeology practices in the State of North Carolina, available information and our professional judgment. No other warranty is expressed or implied.

The data that are presented in this report are indicative of conditions that existed at the precise locations sampled and at the time the samples were collected. In addition, the data obtained from samples would be interpreted as being meaningful with respect to parameters indicated in the laboratory report. No additional information can logically be inferred from these data.

Notes:

- Results reported in mg/kg (milligrams per kilogram).
- ft. BGS: feet below ground surface
- HB Soil Remediation Goals: as reference in Inactive Hazardous Sites Branch Health-Based Soil Remediation Goals.
- NE: Standard not established.
- <: Less than the method detection limit or reporting limit specified in the laboratory report.
- Concentrations in bold face type exceed the HB Soil Remediation Goals.
- I: Estimated value; between the MDL and PQL.
- NR: Not Requested
- V: Present in laboratory blank.
- Soil samples SB-6 through SB-12 collected on 07/24/08 were incorrectly labeled as SB-1 through SB-6, respectively, on laboratory chain-of-custody and laboratory analytical report.

Notes:

- Results reported in mg/kg (milligrams per kilogram).
- ft. BGS: feet below ground surface
- HB Soil Remediation Goals: as reference in Inactive Hazardous Sites Branch Health-Based Soil Remediation Goals.
- NE: Standard not established.
- <: Less than the method detection limit or reporting limit specified in the laboratory report.
- Concentrations in bold face type exceed the HB Soil Remediation Goals.
- I: Estimated value; between the MDL and PQL.
- V: Present in laboratory blank.
- NR: Not Requested
- Soil samples SB-6 through SB-12 collected on 07/24/08 were incorrectly labeled as SB-1 through SB-6, respectively, on laboratory chain-of-custody and laboratory analytical report.

All analyses were performed using EPA, ASTM, NIOSH, USGS, or Standard Methods and certified to meet NELAC requirements.

Flags: ND or U-below MDL; IL-meets internal lab limits; MI-matrix interference; NA-not applicable.

Flags: CFR-Pb/Cu rule; NFL-no free liquids; DRY = dry wt; ASIS = wet wt; C(#) See attached USB code

FLDEP Flags: J(#) -estimated 1:surr. fail 2: no known QC req. 3:QC fail XR or XRPD; 4:matrix int. 5:improper fld. protocol; L-exceeds calibration; Q-holding time exceeded;

FLDEP Flags: T-value<MDL; Y-present in blank; Y-improper preservation; B-colonies exceed range; I-estimated value; between the MDL and PQL;

Lab certification IDs: FLDOH/NELAC E86240; NC 444; SC 96031001; IL/NELAC 200020; VA 00395; KS/NELAC E-10360; TN 02985; GA 917; NJ FL014; PA 68-03756;

Lab IDs: ADEM 40850; USDA Soil Permit# S-35240; The above results relate only to the samples.

EPA 18 is a non-NELAC certifiable parameter. Estimated uncertainty is available upon request.
